

Analytical Results from Laboratories

As a Lab User in ADAMS you must log on using an account set up to create and access Lab Results.

The Lab Results section is used to record results of the tests run on an athlete's sample. It allows the user to record all information related to a sample's findings, however will never display the name of the athlete whose sample it is.

In ADAMS a Lab can only access its own data.

Once a Lab Result record is **Submitted or Partially submitted**, if the sample is an **AAF** (a positive finding) or an **ATF** (an Atypical finding), it will automatically match the sample to an athlete based on criteria in the Lab Results record and in the Doping Control Form that was created when the test was performed on the athlete. This means that it is very important for all information to be recorded accurately.
