

Biological Passport Lab Results (BPLR)

The Biological Passport Lab Results section is used to record results of the blood passport tests run on an athlete's sample. It allows the user to record all information related to a sample's findings, however will never display the name of the athlete whose sample it is.

- Searching for a BPLR
- Creating a BPLR
- Creating a BPLR using Auto-Complete
- Editing a BPLR
- Posting BPLR results
- Importing BPLR results through CSV-files

Once a Biological Result record is **Submitted**, it will automatically match the sample to an athlete based on criteria in the Biological Results record and in the Doping Control Form that was created when the test was performed on the athlete. This means that it is very important for all information to be recorded accurately.

The BPLR-page is based on the template for the Regular Lab results.
